Office Action Summary

Application No.

09/977,600

Applicant(s)

WEBER, WOLF-DIETRICH

Examiner

Christian P. Chace

Art Unit

2189

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --
Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 12 December 2005.
- 2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-3 and 5-21 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-3 and 5-21 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
 2. ☐ Certified copies of the priority documents have been received in Application No. _____.
 3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

Attachment(s)

- 1) ☒ Notice of References Cited (PTO-892)
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
- 3) ☒ Information Disclosure Statement(s) (PTO-1449 or PTO/SB/08)
Paper No(s)/Mail Date 12/12/05.
- 4) ☐ Interview Summary (PTO-413)
Paper No(s)/Mail Date. _____.
- 5) ☐ Notice of Informal Patent Application (PTO-152)
- 6) ☐ Other: _____.

DETAILED ACTION

Response to Amendment

This Office action has been issued in response to amendment filed 12 December 2005. Claims 1-3 and 5-21 are pending. Applicants' arguments have been carefully and respectfully considered, but they are not entirely persuasive, as will be discussed below in detail. Accordingly, as necessitated by the instant amendments to the claims, applicants' arguments, as well as IDS references submitted 12 December 2005, this action has been made FINAL.

Information Disclosure Statement

IDS submitted 12 December 2005 has been considered by examiner. However, foreign patent document WO 01/75620 A1 has only been considered in so much as it is available to examiner. Pages 3, 5, 7, and 9 are missing, as well as figures 2, 4, and 6, as of 4 March 2006. It appears this may have been a scanning error or a copying error, perhaps due to double-sided pages. Either way, with examiner's sincere apologies for any inconvenience and appreciation for applicants' patience in this matter, the easiest way to rectify the situation is to resubmit the document in its entirety, and applicants' are respectfully requested to do so as part of any response to the instant Office action. A signed and initialed copy of the instant PTO-1449 is attached hereto.

Claim Rejections - 35 USC § 102/103

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 1-3, 5-14, and 17-21 are rejected under 35 U.S.C. 102(e) as anticipated by or, in the alternative, under 35 U.S.C. 103(a) as obvious over Strongin et al (US Patent #6,510,497), in view of Novak (WO 01/75620 A1). Novak and Fukuda (US Patent #5,107,257) are also both offered as extrinsic evidence of the inherency of a counter for bus switching. As Fukuda discusses in column 1, lines 24-26, bus switching by counting accesses prevents having to utilize a looped bus.

After careful consideration of applicants' instant remarks, it appears there is some disagreement as to whether a counter is inherent to Strongin et al – that is, a counter necessarily flows from the rest of the disclosure of Strongin et al. Given these

discussions, examiner believes that a prima facie case has been made for the inherency of the counters in the Strongin et al reference.

However, assuming arguendo that one were to be able to interpret the claims differently and not find the counter inherent in the system of Strongin et al, Novak clearly discloses the counter and the motivation for it's inclusion in a system at least equivalent to the Strongin et al system in at least page 6, lines 23-33, which recites that the number of page hit requests serviced consecutively has to be limited to prevent starvation of the other devices, and that this is accomplished through counting the number of requests up to a threshold, set to be from 1 to 32 requests.

Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention, to use the counter and threshold of Novak in the system of Strongin et al to prevent starvation of the other devices, as discussed by Novak on page 6 at line 25.

In addition, with specific respect to claim 21, which invokes interpretation under 35 USC 112, 6th paragraph, applicants' instant remarks appear to indicate that this claim should be interpreted in it's broadest reasonable sense, as applicants appear under the impression that they are not required to point out the corresponding structure in the instant specification, but merely offer an example of a structure that could perform the functions. (See page 8 of instant remarks). Accordingly, it is unclear how the claims should be interpreted under 35 USC 112, 6th paragraph.

Does the corresponding structure in Strongin et al need to be equivalent to that of any or all of the examples offered in the instant specification? Examiner believes that it does not, and the "broadest reasonable" interpretation is appropriate herein.

However, should one argue that Strongin et al does not have corresponding equivalent structure disclosed to that of the instant specification to be anticipatory, certainly the Strongin et al structure is obvious, at least because it is performing the same functions as recited in the instant claims, (also for the same reasons – decrease in latency, see Strongin et al column 12, lines 52-54, e.g.), as is discussed below with respect to at least claim 1; a person of ordinary skill in the art would have recognized the interchangeability of the element shown in the prior art for the corresponding elements disclosed in the instant specification; and that there are insubstantial differences between the applied reference's structure and the examples offered in the instant specification.

Given the discussions supra, the anticipatory rejections are as follows with respect to Strongin et al:

With respect to independent claims 1 and 21, a method for scheduling access to a device is disclosed in the title.

As a result of applicants' instant arguments as discussed supra, claim 21 has been interpreted in it's broadest reasonable sense, as no specific structural means further narrowing the claimed "means" appear to be disclosed – mere examples do not further limit the structure. See MPEP 2181-2184.

Tracking a current state of the device is disclosed in column 11, lines 45-50. This is also disclosed in column 18, lines 22-35 as "determining a status."

Tracking a count of a number of scheduled (i.e., in the buffer) requests which require the current state is disclosed in column 11, lines 55-60, as the number of requests issued and/or amount of time elapsed. Both current and future states would inherently require a count of some sort. A count is one or more, and the particular state is the bus direction, e.g., as is further explained in column 18, lines 22-35. In addition, column 4, line 20 discloses scheduling "one or more requests." Counting the number of those requests necessarily flows from the Strongin et al reference as it could not operate without knowing how many requests there are. In addition, should the number of requests not be counted, then starvation of all but the one device that starts using it would have to occur, because nothing would prevent it from happening. Also, the system knows how many requests are issued per unit time (it must in order to operate). Therefore, it is also known the number of requests issued of the amount of time is known.

Switching the state of the device after determining the count reaches a threshold value established for a switch point (number of pending operations) and receiving one or more incoming requests which require an alternate state to the current state (a different bus direction or a different open bank of DRAM) of the device is disclosed in column 12, lines 20-35. Also see column 18, lines 22-35, which discusses scheduling a number of "tracked" requests based on the bus direction, or "device state." The "switch point" is when the pending requests consistent with the memory bus direction are

issued, and the bus direction reverses, or switches, to allow the scheduled requests that were previously inconsistent with the previous bus direction to now issue. However many requests there are, in a certain bus direction (read or write), in the queue, is the threshold.

With respect to claims 2 and 7, "configuring" the switch point is disclosed in column 12, lines 22-33, which is the number of pending requests. As this number changes, the switch point is "re-configured."

With respect to claims 3 and 12, the switch point being configurable by software is disclosed in column 15, lines 5-10. As discussed with respect to the independent claims upon which the instant claims depends, e.g., claim 1, the switch point is configurable. Strongin et al clearly discuss hardware and software being interchangeable.

With respect to claims 4 and 9, the switch point being "dynamically" configurable is discussed supra with respect to claims 2 and 7. "Dynamic" simply means it changes.

With respect to claims 5 and 11, the device being a DRAM is disclosed in column 13, line 8, for example. The method further comprising selecting a scheduler type from the group consisting of a DRAM bus turnaround scheduler (consistent with the direction of a bus), DRAM page scheduler (targeted to one or more open pages in memory), and DRAM physical bank switching scheduler (identifying one or more closed pages, such as banks, in column 13, lines 50-67, for example) is disclosed in column 14, lines 20-60. In addition, see column 12, lines 11-44.

With respect to independent claim 6, a bus scheduler is disclosed in column 17, line 4 as an arbiter configured to arbitrate between memory requests according to a bus direction.

An input configured to receive at least one incoming request, each request indicating a bus direction is disclosed in column 18, lines 22-35, which discloses pending memory access commands, which are scheduled based on their consistency or lack thereof with the memory bus direction. Inherently, there must be an "input configured to receive" these requests for the system to operate – a computer must be told what to do.

A switch point is disclosed in column 18, lines 22-35 in that the "switch point" is when the first set of pending requests are issued and the bus direction switches to accommodate the second set of pending request that were previously inconsistent with that bus direction.

An indicator of a current bus direction is disclosed in column 18, lines 22-35 and in lines 55-60, which discusses determining the direction of the bus. Inherently, if the bus direction is determined, it is indicated.

A count of requests processed through the current bus direction is disclosed in column 18, lines 22-35 as the "one or more" pending access requests. "One or more" indicates a number, which is a count.

Logic configured to switch the direction of the bus to process incoming requests after the count reaches the switch point and there are incoming requests having the direction opposite to the current direction of the device bus is disclosed in column 18,

lines 22-35, which discloses issuing the requests consistent with a bus direction ahead of, or before, the requests inconsistent with the bus direction. (The logic for implementing this method is disclosed in column 17 and 18 in claims 1-12, for example).

With respect to independent claim 8, a scheduler is disclosed as a memory arbiter in column 17, line 4.

A switch point is disclosed as discussed supra with respect to claims 1 and 6.

A current device state is disclosed as a bus direction and/or a page status in column 18, lines 22-35.

A count is disclosed as "one or more" in column 18, line 30.

Logic configured to "facilitate" an updated device state when the count crosses a threshold of the switch point is disclosed in column 18, lines 22-35, where memory accesses are scheduled based on the bus direction and the page status.

Scheduling the access requests to the device using the updated device state is disclosed in column 18, lines 22-35, which discloses that after the pending requests that are consistent with the device state are issued, the access requests are then issued ("ahead of") that are inconsistent with the previous device state.

With respect to claim 10, the device comprising a bus and the device state comprising a bus direction, said scheduling being dependent upon the bus direction is disclosed in column 11, lines 64-65.

With respect to claim 13, the device comprising a DRAM with multiple pages and the device state comprising the identity of at least one open page, said scheduling being dependent upon the at least one page opened is disclosed in column 11, lines 5-10.

With respect to claim 14, the device comprising a DRAM with multiple physical banks and the device state comprising the last accessed physical bank, said scheduling dependent upon the last accessed physical bank is disclosed in column 15, lines 29-34.

With respect to claims 17-18, a system on a chip, or ASIC, is disclosed in column 14, line 60 into column 15, line 11.

With respect to claims 19-20, a controller of a volatile memory coupled to the scheduler (via the bus) is disclosed in figure 6, #400, e.g.

Filter logic is disclosed in figure 6, #482. It may inherently be configured to do anything. However, one or more threads are disclosed in figure 6, #486 – 1,2, D, e.g., as a thread goes through each, as discussed in column 13, lines 16-38. As discussed in the previous rejection, the “based on...for each thread” is merely an intended result of the actual structure and operation, and, accordingly, will not be given weight. While features of an apparatus may be recited either structurally or functionally, claims directed to an apparatus must be distinguished from the prior art in terms of structure rather than function alone. MPEP 2114.

Claims 15-16 are rejected under 35 U.S.C. 103(a) as being unpatentable over Strongin et al (cited supra). Examiner notes that this has been taken as admitted prior art in accordance with MPEP, as applicants have not traversed the taking of Official Notice in the previous Office action.

With respect to claims 15-16, Strongin et al recite the subject matter of the claims upon which the instant claims depend, as discussed supra.

The difference between the explicit recitation of Strongin et al and the instant claims, is the explicit recitation of a register to store the threshold number of counts to establish a switch point.

It is extremely well known to those of even rudimentary skill in the art that a register may be employed to count requests in a buffer or queue of requests to inform the system of how many particular requests may be present. The examiner takes OFFICIAL NOTICE of this teaching.

Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention, having the teachings of Strongin et al before him/her, to utilize a counter (register) to count the number of requests using a certain bus direction, so the system would know how long to keep the bus going in that certain direction so that service may be provided in the round-robin format discussed by Strongin et al in column 10, lines 27-42, e.g.

Claim Rejections - 35 USC § 102

Claims 1-3, 5, 8-11, 13-16, and 21 are rejected under 35 U.S.C. 102(e) as being clearly anticipated by Novak (cited supra).

While the applied reference is incomplete as discussed supra with respect to the instant IDS; page 4 discloses a DRAM, which is a non-volatile memory. Page 6, lines 2-3, disclose page mode accesses as page hit requests, page miss requests, page miss different chip requests, and page conflict requests. These are the device states. Priority logic block is disclosed at page 6, lines 7-8. Page 6, lines 23-33 discuss the prioritization of the requests wherein a certain preset number of page hit requests will

be issued sequentially to reduce the latency of the system and enhance the utilization of the memory bus, as is disclosed in the abstract.

Response to Arguments

Objections and rejections not repeated herein have been withdrawn.

Accordingly, the arguments in light of the amendments have been persuasive.

However, while the 35 USC 112, 2nd paragraph rejection of claim 21 has been removed, examiner wishes to note that applicants appear to have had the impression that the rejection was made because the words "track" and "tracking" were used several times in the instant specification, *per se*. However, the number of times the words were mentioned was simply discussed in order to show that it was unclear which of the elements relevant to each use of the word was actually performing the function. Examiner apologizes for any miscommunication. Again, as discussed *supra*, claim 21 has been interpreted in its broadest reasonable sense, as applicants, in the instant remarks at page 8, note that the instant specification merely provides examples of the kinds of structures that might correspond to the means. This cannot limit a "means-plus-function" limitation any further than "broadest reasonable" interpretation. See MPEP 2181-2184.

With respect to applicants' argument that Strongin et al fail to disclose tracking a count of a number of scheduled requests. The previous Office action did, indeed maintain that this was inherent in Strongin et al, and examiner continues to maintain that position, especially in light of the discussions *supra*. It is known in a system how many requests are issued per unit time – this is called latency. Therefore, the number

of requests is known if the amount of time is known. Examiner also wishes to note that applicants cite 2131.01 (III) of MPEP as support for the assertion that extrinsic evidence "must be provided" to support an assertion of inherency. However, that section of MPEPO recites that extrinsic evidence "can be" supplied – it does not HAVE to be. However, examiner has attempted to further elaborate on his position, and has offered extrinsic evidence, as well as an alternative rejection under 103. Examiner has interpreted applicants' arguments as requested said extrinsic evidence.

With respect to applicants' argument that Strongin et al fail to disclose switching the state of the device after determining the count reaches a threshold value because all of the access for that state are processed before the state switches. Even assuming arguendo that this were true, there are N locations in the buffer (Column 11, lines 16-20 of Strongin et al). If all of the pending requests for a certain device state and/or bus direction are issued, it could reasonable be interpreted that whatever number of those N pending requests actually issued would be the "count" claimed instantly. The independent claims, e.g., merely recite "tracking a count." They do not positively recite actually counting a number of requests of a certain device state and/or bus direction, out of the total N requests in the queue, at any specific time.

Conclusion

Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire **THREE MONTHS** from the mailing date of this action. In the event a first reply is filed within **TWO MONTHS** of the mailing date of this final action and the advisory action is not mailed until after the end of the **THREE-MONTH** shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than **SIX MONTHS** from the date of this final action.

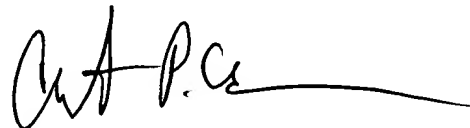

Applicant's submission of an information disclosure statement under 37 CFR 1.97(c) with the fee set forth in 37 CFR 1.17(p) on 12 December 2005 prompted the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 609.04(b). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire **THREE MONTHS** from the mailing date of this action. In the event a first reply is filed within **TWO MONTHS** of the mailing date of this final action and the advisory action is not mailed until after the end of the **THREE-MONTH** shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than **SIX MONTHS** from the mailing date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Christian P. Chace whose telephone number is 571.272.4190. The examiner can normally be reached on MAXI FLEX.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Reginald Bragdon can be reached on 571.272.4204. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
